On the Ternary Non-homogeneous Quintic Equation

$$
x^{2}+3 y^{2}=7 z^{5}
$$

#### Abstract

: The ternary non-homogeneous quintic equation given by $x^{2}+3 y^{2}=7 z^{5}$ is analysed for determining its distinct integer solutions.Also, a generation formula for the integer solutions to the given quintic equation ,being given its particular solution, is illustrated

Key words: Ternary quintic ,Non-homogeneous quintic, Integer solutions
Introduction:
It is well-known that the Diophantine equations ,homogeneous or non-homogeneous ,have aroused the interest of many mathematicians. In particular,one may refer [1-11] for quintic equations with three unknowns.The above problems motivated us to search for the distinct integer solutions to ternary non-homogeneous quintic equation $x^{2}+3 y^{2}=7 z^{5}$

Also, a general formula for generating sequence of integer solutions to the considered quintic equation being given its particular solution is illustrated.

Method of analysis:
The ternary non-homogeneous quintic equation under consideration is

$$
\begin{equation*}
x^{2}+3 y^{2}=7 z^{5} \tag{1}
\end{equation*}
$$

The process of determining non-zero distinct integer solutions to (1) is illustrated below:

## Method 1:

Assume

$$
\begin{equation*}
\mathrm{z}=\mathrm{a}^{2}+3 \mathrm{~b}^{2} \tag{2}
\end{equation*}
$$

Express the integer 7 on the R.H.S. of (1) as the product of complex conjugates as below

$$
\begin{equation*}
7=(2+i \sqrt{3})(2-i \sqrt{3}) \tag{3}
\end{equation*}
$$

Using (2) \& (3) in (1) and employing the method of factorization ,consider

$$
x+i \sqrt{3} y=(a+i \sqrt{3} b)^{5}
$$

Equating the rational and irrational parts , it is seen that

$$
x=2 f(a, b)-3 g(a, b), y=f(a, b)+2 g(a, b)
$$

where

$$
\begin{equation*}
f(a, b)=a^{5}-30 a^{3} b^{2}+45 a b^{4}, g(a, b)=5 a^{4} b-30 a^{2} b^{3}+9 b^{5} \tag{4}
\end{equation*}
$$

Thus,(2) and (4) represent the integer solutions to (1).
Note: 1
It is to be noted that ,apart from (3) ,the integer 7 on the R.H.S. of (1) is also represented as shown below:

$$
\begin{equation*}
7=\frac{(5+i \sqrt{3})(5-i \sqrt{3})}{4} \tag{5}
\end{equation*}
$$

Following the analysis as above ,the corresponding integer solutions to (1) are given by

$$
x=2^{4}[5 f(A, B)-3 g(A, B)], y=2^{4}[f(A, B)+5 g(A, B)], z=4\left(A^{2}+3 B^{2}\right)
$$

Method 2:
Rewrite (1) as

$$
\begin{equation*}
x^{2}+3 y^{2}=7 z^{5} * 1 \tag{6}
\end{equation*}
$$

Consider the integer 1 on the R.H.S. of (6) as

$$
\begin{equation*}
1=\frac{(1+\mathrm{i} \sqrt{3})(1-\mathrm{i} \sqrt{3})}{4} \tag{7}
\end{equation*}
$$

Substituting (2),(3),(7) in (6) and employing the method of factorization, consider

$$
x+i \sqrt{3} y=(2+i \sqrt{3}) \frac{(1+i \sqrt{3})}{2}[f(a, b)+i \sqrt{3} g(a, b)]
$$

Following the analysis as in Method 1,the corresponding integer solutions to (1) are given by

$$
x=2^{4}[-f(A, B)-9 g(A, B)], y=2^{4}[3 f(A, B)-g(A, B)], z=4\left(A^{2}+3 B^{2}\right)
$$

Note 2 :
Substituting (2),(5),(7) in (6) and repeating the above process ,it is seen that (1) is satisfied by
$x=2^{4}[f(A, B)-9 g(A, B)], y=2^{4}[3 f(A, B)+g(A, B)], z=4\left(A^{2}+3 B^{2}\right)$
Note 3 :
In addition to (7) ,the integer 1 on the R.H.S. of (6) is expressed as

$$
\begin{equation*}
1=\frac{\left(3 r^{2}-s^{2}+i \sqrt{3} 2 r s\right)\left(3 r^{2}-s^{2}-i \sqrt{3} 2 r s\right)}{\left(3 r^{2}+s^{2}\right)^{2}} \tag{8}
\end{equation*}
$$

In this case ,the repetition of the above process on considering the equations (2), (3), (8) and equations (2),(5),(8) respectively leads to two more sets of integer solutions to (1). Method 3:

Taking

$$
\begin{equation*}
x=(7 k-5) y \tag{9}
\end{equation*}
$$

in (1), it simplifies to

$$
\left(7 \mathrm{k}^{2}-10 \mathrm{k}+4\right) \mathrm{y}^{2}=\mathrm{z}^{5}
$$

which is satisfied by

$$
\begin{equation*}
y=\left(7 k^{2}-10 k+4\right)^{2} \alpha^{5 s}, z=\left(7 k^{2}-10 k+4\right) \alpha^{2 s} \tag{10}
\end{equation*}
$$

In view of (9), we have

$$
\begin{equation*}
x=(7 k-5)\left(7 k^{2}-10 k+4\right)^{2} \alpha^{5 s} \tag{11}
\end{equation*}
$$

Thus (10) and (11) represent the integer solutions to (1).
Method 4:
Taking

$$
\begin{equation*}
x=(7 k-2) y \tag{12}
\end{equation*}
$$

in (1), it simplifies to

$$
\left(7 k^{2}-4 k+1\right) y^{2}=z^{5}
$$

which is satisfied by

$$
\begin{equation*}
y=\left(7 k^{2}-4 k+1\right)^{2} \alpha^{5 s}, z=\left(7 k^{2}-4 k+1\right) \alpha^{2 s} \tag{13}
\end{equation*}
$$

In view of (12) ,we have

$$
\begin{equation*}
\mathrm{x}=(7 \mathrm{k}-2)\left(7 \mathrm{k}^{2}-4 \mathrm{k}+1\right)^{2} \alpha^{5 s} \tag{14}
\end{equation*}
$$

Thus (13) and (14) represent the integer solutions to (1).
Method 5:
The substitution

$$
\begin{equation*}
y=2 n z^{2} \tag{15}
\end{equation*}
$$

in (1) leads to

$$
\begin{equation*}
x^{2}=z^{4}\left(7 z-12 n^{2}\right) \tag{16}
\end{equation*}
$$

After some algebra ,it is seen that (16) is satisfied by

$$
\begin{equation*}
\mathrm{z}=\left(7 \mathrm{k}^{2}-8 \mathrm{k}+4\right) \mathrm{n}^{2}, \mathrm{x}=(7 \mathrm{k}-4)\left(7 \mathrm{k}^{2}-8 \mathrm{k}+4\right)^{2} \mathrm{n}^{5} \tag{17}
\end{equation*}
$$

In view of (15) ,one has

$$
\begin{equation*}
y=2\left(7 k^{2}-8 k+4\right)^{2} n^{5} \tag{18}
\end{equation*}
$$

Thus,(17) and (18) satisfy (1).

Note 4:
It is to be noted that (16) is also satisfied by

$$
\begin{equation*}
\mathrm{z}=\left(7 \mathrm{k}^{2}-6 \mathrm{k}+3\right) \mathrm{n}^{2}, \mathrm{x}=(7 \mathrm{k}-3)\left(7 \mathrm{k}^{2}-6 \mathrm{k}+3\right)^{2} \mathrm{n}^{5} \tag{19}
\end{equation*}
$$

In view of (15) ,one has

$$
\begin{equation*}
y=2\left(7 k^{2}-6 k+3\right)^{2} n^{5} \tag{20}
\end{equation*}
$$

Thus,(19) and (20) satisfy (1).
Method 6:
The substitution

$$
\begin{equation*}
\mathrm{y}=(2 \mathrm{n}-1) \mathrm{z}^{2} \tag{21}
\end{equation*}
$$

in (1) leads to

$$
\begin{equation*}
x^{2}=z^{4}\left(7 z-3(2 n-1)^{2}\right) \tag{22}
\end{equation*}
$$

After some algebra ,it is seen that (22) is satisfied by

$$
\begin{equation*}
\mathrm{z}=\left(7 \mathrm{k}^{2}-4 \mathrm{k}+1\right)(2 \mathrm{n}-1)^{2}, \mathrm{x}=(7 \mathrm{k}-2)\left(7 \mathrm{k}^{2}-4 \mathrm{k}+1\right)^{2}(2 \mathrm{n}-1)^{5} \tag{23}
\end{equation*}
$$

In view of (21), one has

$$
\begin{equation*}
y=\left(7 k^{2}-4 k+1\right)^{2}(2 n-1)^{5} \tag{24}
\end{equation*}
$$

Thus,(23) and (24) satisfy (1).
Note 5:
It is to be noted that (22) is also satisfied by

$$
\begin{equation*}
\mathrm{z}=\left(7 \mathrm{k}^{2}-10 \mathrm{k}+4\right)(2 \mathrm{n}-1)^{2}, \mathrm{x}=(7 \mathrm{k}-5)\left(7 \mathrm{k}^{2}-10 \mathrm{k}+4\right)^{2}(2 \mathrm{n}-1)^{5} \tag{25}
\end{equation*}
$$

In view of (21) ,one has

$$
\begin{equation*}
y=\left(7 k^{2}-10 k+4\right)^{2}(2 n-1)^{5} \tag{26}
\end{equation*}
$$

Thus,(25) and (26) satisfy (1).
Remark : In a similar manner,one may consider the relations between $x, z$ as in (15),(21) and obtain the corresponding four more sets of integer solutions to (1).

Observation: Generation formula
Let $\left(\mathrm{x}_{0}, \mathrm{y}_{0}, \mathrm{z}_{0}\right)$ be a particular solution to (1).

Then ,the formula for generating a sequence of integer solutions to (1) is presented below:

$$
\begin{aligned}
& x_{s}=\frac{\alpha^{\mathrm{s}}+3 \beta^{\mathrm{s}}}{4} x_{0}+\frac{3\left(\alpha^{\mathrm{s}}-\beta^{\mathrm{s}}\right)}{4} y_{0} \\
& y_{\mathrm{s}}=\frac{\alpha^{\mathrm{s}}-\beta^{\mathrm{s}}}{4} x_{0}+\frac{3 \alpha^{\mathrm{s}}+\beta^{\mathrm{s}}}{4} y_{0}, \\
& z_{\mathrm{s}}=2^{2 \mathrm{~s}} \mathrm{z}_{0}, \mathrm{~s}=1,2,3, \ldots
\end{aligned}
$$

where

$$
\alpha=2^{5}, \beta=-2^{5}
$$

An example has been given in Table 2 below:
Table 2- Example

| s | $\mathrm{x}_{\mathrm{s}}$ | $\mathrm{y}_{\mathrm{s}}$ | $\mathrm{z}_{\mathrm{s}}$ |
| :--- | :--- | :--- | :--- |
| 0 | 2 | 1 | 1 |
| 1 | $2^{4}$ | $3^{*} 2^{4}$ | $2^{2}$ |
| 2 | $2^{11}$ | $2^{10}$ | $2^{4}$ |
| 3 | $2^{14}$ | $3^{*} 2^{14}$ | $2^{6}$ |

Conclusion:
In this paper , an attempt has been made to obtain non-zero distinct integer solutions to the ternary non-homogeneous quintic equation $x^{2}+3 y^{2}=7 z^{5}$

As the quintic equations are rich in variety, one may search for the integer solutions to other choices of quintic equations with three or more unknowns.
